

1 Cursor movement

command	description
<code>z<ENTER></code>	makes current line the top line of the page
<code>Z<ENTER></code>	makes current line the top line of the page
<code>%</code>	move to matching bracket, parentheses, etc.

2 Searching

3 Mapping

<code>:map <ENTER> a<ENTER><ESC></code>	use return to break lines without going into insert mode.
<code>:map <F9> 0701</code>	shortcut for moving to right edge of screen (not working).

4 Misc

4.1 ‘set’ options

4.1.1 Syntax

```
:set mycommand
```

4.1.2 Examples

```
:set ignorecase
```

```
:set tabstop = 4
```

 tab four spaces instead of the default of eight

```
:set expandtab
```

 tabs are converted to spaces (useful since not every computer handles tabs the same way, but note that makefiles will not work without actual tabs).

```
set spell
```

 Spellcheck! Do this in command mode; leaving it on will probably get really annoying.

5 Buffers

5.1 Other

```
:edit!
```

 or `:e!` Undoes all edits since last write

```
:cal cursor(row, column)
```

 Go to row, column. What can you put in for “row” to indicate the current line the cursor is in?

```
:help map-which-keys
```

 Tells what keys are currently in use.
